I. INTRODUCTION

This documentation was prepared to facilitate use of the NLS school file prepared from information collected, processed, and systematically stored for the National Longitudinal Study of the High School Class of 1972 (NLS), conducted under contract to the National Center for Education Statistics, Office of the Assistant Secretary for Educational Research and Improvement, U.S. Department of Education.

The NLS school file is a companion file to the NLS student based data file.[1/] The school file is composed of 1,318 school records, one record for each high school from which NLS students were sampled. This file contains information about the environment, staff, procedures, facilities and curricula of the NLS sample high schools. The 504 variables that make up the file are primarily from the School Questionnaire and/or one or two Counselor Questionnaires for each of the 1,318 participating schools.

II. ORIGINAL SAMPLE DESIGN

The sample design for the NLS is a stratified, two-stage probability sample of students from all schools, public and private, in the 50 states and the District of Columbia, which contained twelfth graders during the 1971-72 school year.[2/] The study excluded students from schools for the physically or mentally handicapped, schools for legally confined students, and special school situations (such as area vocational schools) where students were also enrolled in other high schools in the sampling frame.

The first-stage school sampling frame was constructed from computerized school files maintained by the Office of Education and the National Catholic

1/ The student-based data file is documented in National Longitudinal Study: Base Year (1972) through Fourth Follow-Up (1979) Data File Users Manual, Volumes I, II, III. John Riccobono, Louise B. Henderson, Graham J. Burkheimer, Carol Place, and J. R. Levinsohn, Center for Educational Research and Evaluation, Research Triangle Institute, Research Triangle Park, N.C., June 1981.

Education Association. It was divided into 600 final strata based upon the following variables:[3/]

- Type of control (public or nonpublic)
- Geographic region (Northeast, North Central, South, and West)
- Grade 12 enrollment (three size categories)
- Proximity to institutions of higher learning (3 distance categories)
- Percent minority group enrollment (8 categories, public schools only)
- Income level of the community (11 categories, public schools; 8 categories, Catholic schools)
- Degree of urbanization (10 categories).

In the smallest size strata (fewer than 300 seniors), schools were selected with probabilities proportional to the estimated number of senior students; in the remaining size strata, schools were selected with equal probabilities. All selections were without replacement. The potential for including disadvantaged students in the sample was increased by sampling schools in low-income areas and schools with a high proportion of minority group enrollment at twice the rate used for the remaining schools.[4/] Within each final stratum, four schools were selected, and then two of the four were randomly designated as the primary selections. The other two schools were retained as backup or substitute selections for use only if one or both of the primary schools did not cooperate.

The second stage of the sampling procedure consisted of first drawing a simple random sample of 18 students per school (or all if fewer than 18 were available) and then selecting five additional students (if available) as possible replacements for nonparticipants. In both cases, the students within

[3/] The total number of classes that would be defined by a cross-tabulation of these stratification variables is far greater than the number of cases that could, in fact, have been utilized in the stratification. Consequently, it was necessary to consolidate or ignore, in some instances, some of the stratification criteria through a procedure for assigning priority to the variables. A determination of the final strata involved these priority considerations, but also involved judgment in consolidating the various classes to produce strata of the desired sizes.

[4/] Income for any area was based upon either an adjusted 1960 Census median income of the county containing the school, or the average adjusted gross income determined from the 1966 tax returns with the same five-digit ZIP code as that for the school. The minority group enrollments for individual schools were determined from either the records of the Office of Civil Rights or the 1970 Census data by counties.

a school were sampled with equal probabilities and without replacement. Early (i.e., mid-year) graduates and those attending adult education classes were excluded from the sampling.

III. SAMPLE REDEFINITIONS AND AUGMENTATIONS

Of the 1,200 primary sample schools, 948 participated in the base-year survey, 21 had no senior students enrolled, and 231 either refused to participate or could not participate because the request was received too late in the school year. Due to this large school nonresponse, further attempts were made to secure participation of the 231 nonparticipant primary sample schools and replacements for the 21 schools that had no seniors. This "resurvey" activity, initiated by NCES in the period prior to the first follow-up survey, involved securing school cooperation and selecting random samples of up to 18 former students (1972 seniors) per school. The "resurvey" activities, were successful in 205 of the 231 primary sample schools; thus, students from 1,153 of the 1,200 primary sample schools were included in the first follow-up and subsequent surveys.

Students selected from backup or substitute schools were also included in the base-year and follow-up surveys. In the base-year survey, 121 backup schools participated--including 16 schools which were "extra" in their final stratum. A backup school was termed "extra" if both primary sample schools from that stratum also participated. Students from the 26 "extra" schools were not included in the first follow-up survey, but additional backup schools were included to obtain at least two participating schools in the first follow-up survey from each of the 600 original strata. In the second and later follow-up surveys, 18 of these "extra" schools were included to avoid elimination of cases with complete base-year data.

Samples of former 1972 senior students were also selected from 16 sample augmentation schools; these schools were selected from those identified in 200 sample school districts canvassed to identify public schools not included in the original school sampling frame. The augmentation schools defined eight additional strata (601-608). Samples of students selected from the 16 augmentation schools were not included in the base-year survey but were included on subsequent surveys. Table 1 summarizes school representation.

Table 1.--Total number of participating schools, by survey

Sample	Base-year survey	First follow-up survey	Final sample for follow-up surveys
Primary sample	948	1,153	1,153
Backup sample:			
"Extra" in base-year	26*	--	18
Other	95	131	131
Augmentation sample	--	16	16
Total	1,069	1,300	1,318

* Eight of these 26 extra schools have been dropped from the NLS sample. No student data were collected from the dropped schools in any of the survey periods.

IV. TECHNICAL SPECIFICATIONS

The NLS school file consists of 1,318 records. Each record is 1,284 bytes long and contains 504 variables. The block size is 32,100 bytes with a fixed-block format. The file resides on nine-track tape with IBM standard labels and data set name SCHOOLS.INHOUSE.JUNE81. One reel of tape holds the file using a recording density of 6,250 bytes per inch. Included on the same tape is the codebook for the school file; its data set name is NLSCDBK.SCHOOL.WITHLBLS. A listing of the codebook for the school file is included in this document as Appendix B.

V. ORGANIZATION OF THE REMAINDER OF THIS DOCUMENTATION

Included in Appendix A are copies of the school data collection instruments--the School Questionnaire and Counselor Questionnaire.[5/] Appendix B contains a summary listing of each variable contained in the file. This listing provides,

[5/] Counselor Questionnaires were not collected from the resurvey schools that were contacted during first follow-up operations.

for each variable, the variable number, the short label, the location of the implied decimal point (if blank, the variable is a whole number), the tape position, and a long label. This appendix serves as a quick guide to the contents of the file.

Appendix C presents a complete and detailed listing of the variables and variable frequency distributions in the data file. For each variable in the file, the variable number, a short variable label, the tape location, a longer variable description, and a completely labeled frequency distribution (for all categorical codes that occur for that variable) are presented. For several items, individual code tabulations would not be appropriate; in these cases group frequencies are reported, or only the frequency of data within the minimum to maximum range of the item and the error codes for the item are given. The fields that contain alpha-numeric information are documented as such in the frequency distributions.

For the several routing items[6/] contained in the School Questionnaire and the Counselor Questionnaire there may possibly exist codes to which 20 has been added, indicating a violation of the logic of the skip pattern. A value label containing "X" denotes the addition of 20 to the datum.

For School Questionnaire items 7 and 10 (SCHQ7A - SCHQ7F, SCHQ10A - SCHQ10E) the response code indicated in the questionnaire was changed to "1," indicating a positive response. For these items, the possible values that exist on the school file are "1" and the error codes.

For some variables, response values were collapsed for presentation purposes due to the large number of possible responses. This collapsing is indicated in frequency distributions by category labels specifying defined ranges. Consider the two sample Tables 1 and 2.

In sample Table 1, individual code tabulations are reported. The values in the "CODE" column actually exist on the data file. The category labels for these values correspond to the item response descriptions for school question 40 (SCHQ40).

In other cases, where data have been collapsed for reporting, the value in the "CODE" column is arbitrary and has been deleted. Sample Table 2

6/ Items 7A, 7B, 10A, 10B, 13, 37A-37K in the School Questionnaire are routing items; Counselor Questionnaire items 7A - 7R are also routing questions.

illustrates the collapsing procedure. Group frequencies are reported for the ranges indicated by the category labels. It should be noted that no values are presented in the "CODE" column. This is the result of temporarily collapsing the ranges for printing; the full range of values is present in the data file. The distribution presented in Sample Table 2 indicates that the possible range of values is 0 to 999. Reference to the questionnaire item being summarized (see instruments in Section 2) will aid in definition of what exact values can be expected in the data file for continuous variables.

The tabulations of the variables are listed in the order that the variables appear in the data file.

VI. SCHOOL FILE WEIGHTS

During the sequential determination of final school sample membership, including augmentations, several school sampling weights were computed. In most instances, the principal purpose of the various school weights was to serve as a basis for subsequent computation of student weights as applicable to one or more of the several student instruments. Several such intermediate school weights have been historically maintained intact on the School File, most of which are inapplicable for analysis of School File data. Specifically, there are eight weights included on the school file, as indicated below.

Variable Number	Record Position	Description
2	5 - 9	Adjusted Base Year School Weight
481	1204 - 1211	Adjusted Counselor Weight
482	1212 - 1219	Unadjusted Counselor Weight
488	1225 - 1232	Student Test Battery Weight
489	1233 - 1240	Student Record Information Weight
490	1241 - 1248	Student Base Year Questionnaire Weight
493	1255 - 1259	Unadjusted Base Year School Weight
504	1280 - 1284	School File Sample Weight.

All of these weights are represented on the file with two implied decimal places (though not always indicated as such in the codebook). Of these eight weights, only two (variables 481 and 504) are of direct use in analyzing School File or other school level data.

The school file sample weight (variable number 504) is appropriate for analyzing school level data that potentially could have been supplied by all 1,318 schools. This includes the School Questionnaire data on this file since all 1,318 schools were requested to supply these data. The adjusted counselor weight (variable number 481) should be used only in analyzing the responses to the Counselor Questionnaire; however, care must be excercised when analyzing these data. This questionnaire was only administered at Base Year responding schools and data were collected from either one or two counselors at each school. Consequently, analyses should accomodate for the differing number of counselors providing data at different schools (e.g., proper combination of first counselor data [variables 244-335] with second counselor data [variables 336-427], when data from two questionnaires are available for a school).

VII. MERGING WITH STUDENT DATA

The data in the School File can be merged with individual records in the NLS-72 public release data file using the final stratum number and school codes which are common to both files. The NLS-72 public release file is in order by final stratum number (variable number 21), by school code (variable number 4) within final stratum numbers, and by RTI identification number (variable number 1) within school codes. The School File is in order by final stratum number (variable number 498) and by school code (variable number 1) within final stratum numbers.
